# INDIANA NUT NURSERY

ESTABLISHED IN 1910

J. F. WILKINSON, Proprietor  
ROCKPORT, INDIANA

PRODUCER OF

## High Grade Hardy Northern Nut Trees

TO CUSTOMERS AND FRIENDS

This catalogue is sent to past customers as a reminder that I remember them and appreciate their business, and solicit their future orders; to prospective nut tree buyers as an invitation to become one of my customers.

My nursery is located in the heart of the northern pecan tree territory in a soil especially adapted to growing nut trees where they grow an unusually good root system, making them easy to transplant and quick to start growth.

Nut trees are the longest lived of all food producing trees, and once established require less care and attention than fruit trees, as they do not need to be sprayed and after the head of the tree is once formed little or no pruning is necessary.

Budded or grafted trees bear early. An orchard of them in a few years should come into profitable bearing, and will last for a century or more. Plant only budded or grafted trees of Hardy Northern varieties.

Planting a nut orchard is not a speculation, if the right kind of trees are planted, but an investment one that will in a few years pay increasing annual dividends, not only to the planter but to future generations as well. It is just as much a mistake to buy the cheapest nut trees you can buy as it is the cheapest article of clothing.

There are thousands of acres of land in each state, not producing enough to pay the taxes, that would return handsome profits if planted to nut trees.

As nut trees live so long and attain such a great size they should be planted very wide apart, so they may be grown on land that is to be annually cultivated to grain crops, and interfere very little with cultivation.

Nut tree planting should not be confined to orchards, they may be grown almost anywhere a tree is wanted, they make beautiful shade, and a few of them planted around the home serve the twofold purpose of shade and food.

Nuts are not perishable, and may be kept throughout the year without special care, neither do they have to be gathered promptly as do peaches or apples.

Nuts are no longer considered a luxury, but a staple article of food, and are used extensively by candy manufacturers, bakeries, ice cream companies, as well as in the home.

This being the natural home of the Hardy Northern Pecan Tree, my nursery stock is grown under natural conditions, giving them all the strength and vigor possible for a tree to have.

The soil in which my nursery is located is especially adapted to this, as it is underlaid with a strata of hard soil which discourages the downward growth of the tap root at a depth of about four feet, causing many lateral and feeder roots to develop near the surface that would not in a sandy or loose sub-soil. This gives my trees a

Ten year OHIO WALNUT tree standing in a pasture lot and not cultivated. This variety is also a good cracker, and a prolific bearer.

superior system of lateral roots making them easy to transplant and quick to start growth.

Delayed planting means delayed returns. A tree planted this year is always a year ahead of

a tree planted a year later, and the difference is not the amount of the first, but always the amount of the last crop borne.

#### WHEN TO ORDER

Early ordering of trees is advised. Orders placed well in advance of shipping season, will be shipped on any date requested, weather permitting, while those placed during the rush season are sent out in the order they are received.

A liberal discount will be allowed on advance orders, as these are a saving to me in advertising and correspondence during rush season.

Also by placing order in advance you are sure of being in time to get the size and varieties

Ten year old THOMAS WALNUT tree bearing a bountiful crop of nuts. This variety cracks well, kernels come out in quarters and halves.

wanted, as later, stocks of some kinds are often exhausted.

#### WHEN TO PLANT

Nut trees may be planted either Spring or Fall. I usually start shipping in Spring as early in

March as weather will permit and continue until about the first of May, though would advise those ordering, especially from south of here, to plant by middle of April.

Fall shipping starts as soon as leaves are off in October, and is continued until cold weather.

### **CARE OF TREES ON ARRIVAL**

If conditions will not permit planting when trees are received, unpack and heel them in a trench, not putting them more than two deep.

### **PLANTING INSTRUCTIONS**

Have holes dug before taking trees out for planting. The holes should be deep and large enough to allow all roots to be placed in their natural position.

Take out only a few trees at a time to be planted and while one is being planted protect the roots of others from sun and wind by wrapping in wet burlap. Do not at any time expose roots to the sun and wind any more than is absolutely necessary.

Cut off the ends of all bruised or broken roots, as a fresh cut will callous over quicker than an old one.

Fill in around roots with well pulverized dirt, using only top soil, and firm the dirt well about the roots, being sure to not leave any air spaces.

Plant trees about the same depth as they grew in the nursery, not more than two or three inches deeper at most and do not use any manure where it will come in contact with the roots.

Remember that a tree is a living plant and that its future depends on the care you give it from the time it comes into your possession.

### **AFTER CARE**

Nut trees will readily respond to cultivation and fertilization. It is well, in the spring before time for dry weather, to mulch trees well to keep ground around them cool, moist straw, leaves, or strawy manure may be used. If the latter is used, keep it away from the body of the tree. After the first season cultivation should be given.

If trees are planted in the fall, and many planters, prefer fall planting, then mulch well before cold weather, the mulch will prevent sudden freezing, and thawing of the ground, which causes ground to heave, and might pull tree slightly out of ground.

The production of nut trees in nursery is slow, and the propagation is both difficult, and expensive, making them higher in price than most kinds of food producing trees.

They are also more valuable, and I take special care in digging, use only the very best packing material (which is expensive) to insure trees reaching customer in best possible condition, and ask you to give them extra care for which they will reward you in the future.

Many reports, verified by photographs, have been received of unusual production of these

young trees of the named northern varieties of both walnut and pecan.

I have had the pleasure of seeing many of these fruiting over a wide range of the Northern Nut Tree Territory.

Nut trees live to be very old and attain great size, and should be planted 50 or 60 feet apart each way in orchard planting, requiring but few trees per acre, making the planting cost no more than for fruit trees.

When the head of a nut tree is once formed, no more pruning is necessary and as they are not bothered by insects, so common to fruit trees, spraying is not required.

Nuts do not have to be gathered as soon as ripe. Harvesting may be delayed to suit the con-

Close up view of a six year old OHIO WALNUT tree.

venience of the gatherer. Nuts are not perishable and may be kept during winter without protection from cold, they may also be placed in cold storage and kept fresh during the following summer.

#### **BLACK WALNUT**

The black walnut is found growing in many parts of the United States as a natural forest tree, and has always been considered so common

that its true value as a food producing tree has been overlooked.

On account of the high value of walnut lumber for special purposes, much of the walnut timber has been cut in the past few years, which has greatly reduced the supply of nuts.

As the food value of walnuts is becoming better realized and the supply of nuts decreased the price has greatly advanced.

With power machinery now being manufactured, both for hulling and cracking walnuts, which greatly reduces the cost of getting walnut kernels on the market, makes the future of growing these superior varieties a most promising industry.

The black walnut kernel is one of the richest of all nut kernels, and said to be the only one re-

Ten year old STABLER WALNUT tree. This tree has borne regularly since four years old. Many of the Stabler walnuts have only one kernel which comes out whole when cracked.

taining its original flavor after being cooked. This nut has become very popular and is exten-

sively used by bakers, candy makers and in ice cream parlors, as well as in the home.

While there are yet many native grown walnut trees, the nuts produced by these generally are poor crackers and bring only a small price and will not be wanted at all commercially when the better varieties are obtainable, as the cost of cracking and picking these out would make them expensive as a gift compared with these named varieties even at a fancy price.

Many are now planting orchards of the named varieties which will in a few years put these nuts on the market where their value will become generally known, creating a demand for them that cannot be supplied for many years.

There is now much unproductive land that

---

Eight year old THOMAS WALNUT tree, nuts look small due to distance picture was taken.

---

could be made profitable by planting a walnut orchard.

Walnut trees will thrive on a variety of soils, and may be planted almost anywhere a tree is wanted, on fairly fertile, well-drained land.

Whether it be a commercial planting, or a few trees for home use, plant some walnut trees.

After years of search and the testing of thousands of samples, several varieties have been found of superior quality, which are thin shelled, easily cracked, and in most cases with little care the kernels can be gotten out in whole halves.

The varieties listed are considered the best known by leading nut tree authorities.

### **THE WALNUT AS A TIMBER TREE**

The Black Walnut is a two-fold purpose tree! These improved varieties of walnut produce a superior nut, which with the increasing demand for walnut kernels bring a handsome annual revenue, and when the tree has served its

Eight year old STABLER WALNUT tree bearing its fourth crop of nuts.

time as a nut producer (which is many years) the tree can then be sold for lumber. Much of the walnut timber was cut during and since the war time, leaving the supply limited but not the demand, as walnut has no equal for furniture, finishing lumber, radio cabinets, and many other uses.

Three year old THOMAS WALNUT tree. Consider the difference in value, and pleasure of having a tree like this, instead of a maple, or other non-producing tree.

---

### CHESTNUTS

The Chestnut is native to most of the Eastern, and central states, but in the past few years practically all the native Chestnut trees have been killed by the blight, which is an imported disease.

To replace these valuable trees the Chinese and Japanese varieties have been imported, these are highly resistant to the blight, and are growing and bearing in the blight affected territory without showing signs of this disease.

Chestnut trees are native to upland, and will grow on poor soil, though like any other tree

will do better on good soil, and will readily respond to cultivation.

Chestnut trees bear very young, often produce a few nuts the second or third season.

Like most other kinds of nut trees, it is well to plant two or more varieties for purpose of better pollination.

The supply of these trees is limited in nurseries.

Carr (Chinese) Tree a good grower, nuts large of splendid quality, ripens early.

Hobson (Chinese) tree fast grower, nuts above average size, fine quality a few days later than Carr.

Austin (Japanese) Ripens early, nut large of good quality.

Price of Chestnut trees:

	Each	Per 5
4x5 feet .....	\$2.00 .....	\$9.00

---

## PERSIMMON

This tree is so well known that little need be said about it.

These trees will grow on almost any kind of soil, and produce fruit which is very delicious in the late fall. Several varieties are now being propagated, of which the following are all very good, Colby, Miller, Penland, and Hicks.

Price of Persimmon trees:

	Each	Per 5
3x4 feet .....	\$1.00 .....	\$4.25
4x5 feet .....	1.25 .....	5.50
5x6 feet .....	1.50 .....	7.00

Five year old OHIO WALNUT tree bearing its second crop of nuts.

---

STABLER WALNUT kernel. Note the difference in kernels from these budded trees as compared with the native seedling walnuts.

---

Kernels like the above can easily be gotten out of these large thin shelled pecans.

## **NO TREE PLANTING IS COMPLETE WITHOUT NUT TREES**

Regardless of how many kinds and varieties of trees you may have, your planting is not complete without nut trees, for no other tree product will take the place of nuts. Fruit cannot be kept as long or with as little care and expense as nuts, or be used in as many ways.

### **TOPWORKING**

Small seedling nut trees may be worked over to these valuable varieties. For this work I am prepared to furnish graft-wood or bud-wood in season. Also each season I do a limited amount of this work for others and will be glad to give you an estimate on request. Bud-wood or graft-wood may be sent by parcel post. Usually trees can be topworked as cheap as the price of a tree, and by grafting or budding on to an established stock several years old you soon have a bearing tree.

### **GUARANTEE**

All trees are guaranteed to be fresh stock, carefully dug and packed and delivered to transportation company in good condition; also to be true label, and should any prove not to be, will on proper proof replace them, but will not be liable for further damages.

### **TERMS**

For immediate shipment, cash with order; on orders booked, 50 per cent with order balance, due when stock is ordered shipped.

### **SHIPPING**

Express shipments advised, and unless otherwise ordered all tree shipments will be made by express. Should size or variety ordered be exhausted, order will be filled with its nearest likeness in stock unless no substitution is stated in order.

### **COMPLAINTS**

For errors, shortage of stock or other cause to be entertained, complaints must be made within five days of receipt of shipment.

### **REFERENCE**

I am a member and past president of the Northern Nut Growers' Association, and bank reference, or list of satisfied customers will be sent on request.

### **IN CONCLUSION**

A volume could be written on the merits of nut trees, but for convenience in mailing this has been briefly written, touching on only the more important points, as learned from my own experience and observation.

Any information not given herein will be gladly given on request.

**J. F. WILKINSON.**

**Every Tree Planter Should Plant Nut Trees**

## VARIETIES OF WALNUTS

---

**THOMAS**—Parent tree in Pennsylvania. Nut large, thin shell, cracks good, has splendid flavored kernel. Tree is a fast and upright grower.

---

**STABLER**—Parent tree in Maryland. Nut medium size, thin shell and excellent cracker. Quality of kernel good. Tree prolific bearer.

---

**OHIO**—Parent tree in Ohio. Nut medium size, much the same type as Stabler. Good cracker,

with good quality kernel. Tree good and up-right grower. Prolific bearer.

Have a few trees each of Rohwer and Stam-baugh, two of the newer varieties, both very good ones.

### LAMB CURLY WALNUT

This tree was located and introduced by Mr. George N. Lamb, then secretary and manager of the American Walnut Mfg's., Association of Chi-cago. In writing me of this tree Mr. Lamb said in part:

"Unquestionably, it was one of the most thor-oughly figured trees ever discovered. The figure in this tree was quite apparent, even in the small branches, while the Forest Products Labo-ratory found evidence of a developing figure in the twigs not over five years old." He further stated the veneer cut from this tree, brought a very fancy price. A planting of these trees would be a most valuable possession.

The varieties listed above are considered the best known by leading nut tree authorities.

### PRICES OF ABOVE VARIETIES OF WALNUT TREES

(Budded or Grafted)

	Each	Per 10
2 to 3 feet .....	\$1.75	\$16.50
3 to 4 feet .....	2.00	18.50
4 to 5 feet .....	2.25	21.00
5 to 7 feet .....	2.50	22.50

(Write for prices on quantities)

### VARIETIES OF PECANS

**MAJOR** — Originated in Henderson County, Ky. Parent tree very large, prolific and an an-nual bearer. Nut medium to small, almost round, thin shell, plump kernel, of fine quality, splendid cracker. An ideal nut for the confec-tioner.

**GREENRIVER**—Originated in Henderson County, Ky. Parent tree very large and prolific, and is a very regular bearer. Nut of good size, plump kernel, of fine flavor, good cracker. A very desirable nut for home use, as well as a favorite for the market.

---

**POSEY**—Originated in Gibson County, Ind. Parent tree medium size, said to be regular bearer but not so prolific as some other varieties. Nuts very large, thin shell, and an excellent cracker.

---

**INDIANA**—Parent tree stands near the Busseron. Tree medium size, annual and very prolific bearer. The nut is very much the same as the

Busseron in size and shape. Thin shell and good quality.

---

**BUSSERON**—Originated in Knox County, Ind. Parent tree, very old, and said to be one of the best bearing trees in that section. Nut medium size, kernel of rich flavor.

Busseron pecan is very similar to Indiana, and Butterick is of Major type.

---

**GILES**—Parent tree grows in Southeast Kansas. Tree located, named and introduced by myself. In the three successive years that I visited this tree it had splendid crops of nuts, also it is proving very satisfactory here. Nut is medium to large, very thin shell, splendid kernel of high quality.

---

**GALLATIN**—Parent tree in Illinois, nut medium size, kernel of good quality. A promising new variety.

---

### **HYBRID VARIETIES**

(Cross between pecan and hickory)

**McCALLISTER**—Originated in Posey County, Ind. This variety is a cross between pecan and hickory. Nut is very large, having a pecan shaped kernel which comes out in whole halves, with flavor of both pecan and hickory. This is the largest nut of the pecan-hickory species being propagated.

---

**BURLINGTON**—Parent tree is near Burlington, Iowa. This is also a hybrid, as the McCallister, though the nut is so large. Tree is said to be a regular and prolific bearer. Nut large, thin shell, quality of kernel good.

---

**BIXBY**—A hybrid of unknown parentage. This tree ( in my nursery) supposedly grew from a bud taken from some scion wood sent me by Mr. Willard G. Bixby. Though when I showed him the nuts produced by this tree he could not identify them or give me any information on parentage of this variety, stating that he had never seen any nuts like them. As nothing could be learned of its parentage I have named it Bixby. Nut is large, thin shelled, good cracker, and tree promises to be a good bearer.

---

### **PRICES OF PECAN AND HYBRID TREES** (Budded or Grafted)
